

TERM PROJECT ANNOUNCEMENT

Deadline : 06.05.2025 Wednesday 12:00 (noon)

Software Project Management & Technical Monitoring

Dear Students,

As part of our Software Project Management course, it is time to announce your comprehensive group term project! This project is designed to bridge the gap between theoretical management frameworks and practical software engineering.

Your task is to design and plan a software solution with a strong dual focus on **Management Monitoring** (tracking progress, costs, and schedule) and **Technical Monitoring** (tracking system performance, error rates, and stability).

Please read the following guidelines, rules, and deliverable requirements carefully.

Team Formation & Role Assignment

- **Group Size:** You must form groups of **6 to 8 students**.
- **Role Assignment:** Every team member must have a clearly defined role. We expect you to simulate a real-world environment by assigning roles such as Project Manager, Lead Developer, QA/Tester, UX/UI Designer, Risk Manager, and Operations Lead. Collaboration across these roles is essential for success.

Core Project Requirements

Your project must successfully integrate the following crucial components:

1. **Software Design & Analysis Principles:** Your project must be compatible with standard software design principles. It should demonstrate an understanding of maintainability, scalability, and cohesion.
2. **Basic UI Design:** You are expected to design a basic User Interface (UI) for your proposed software or monitoring dashboard to enhance the user experience.
3. **Value Creation:** You must clearly define the business value of your project, demonstrating how the benefits will exceed the costs to the customer and align with broader business goals.
4. **Stakeholder Management:** Identify your key stakeholders (both internal and external) and outline how you will manage their expectations, varying concerns, and communication needs.
5. **Risk Management:** This is a crucial element. You must include a structured risk management framework outlining how you will identify, assess, mitigate, and monitor potential project and technical risks (e.g., technical debt, schedule overruns, or market shifts).

Deliverables & Submission Guidelines

1. The Project Report (One Unique Report per Team)

- Your team must submit **one unique, comprehensive report** detailing your project's scope, design, monitoring strategies, and risk/value assessments.
- **Mandatory:** The first page of your report must explicitly list **every student's name alongside their specific assigned role and exact responsibilities** for the project.

2. In-Class Presentation

- Each team will pitch their project to the class.
- **Time Limit:** Presentations must **NOT exceed 7 minutes**. You must practice to ensure your timing is exact.
- Keep your visual aids clear and focus on telling a compelling story to engage your audience and clearly convey your core message.

3. Video Recording Backup (Link Only)

- As a backup, and to ensure you have rehearsed your pitch, your team must record a video of your presentation.
- **Do NOT submit the video file.** Upload your video to a platform (e.g., YouTube, Vimeo, Google Drive) and submit **only the link** alongside your report. Ensure the link permissions are set so that the instructional team can view it.

Please finalize your groups of 6-8 and designate your roles by the end of this week.
